CS564 Fall '14: SQL Assignment

Individual Assignment

Due: Tuesday, October 14th by 11:30 PM

1 Introduction

In this assignment you will use **SQLite3** to execute a few SQL queries. You can find documentation on SQLite3 at here. SQLite3 is not as functional as PostgreSQL or MySQL or the commercial relational DBMSes, but it is much easier to use and query. That is why there are rumoured to be many more installations of SQLite than PostgreSQL or any other traditional DBMS. Also, you can easily install SQLite3 on your own machine, but make sure your final SQL queries run on SQLite3 installed on the **CS mumble machines**.

For this assignment, we will use the US Census Population Estimate dataset, which can be found <u>here</u>. We have downloaded and cleaned this dataset and inserted it into a sqlite database called *census.db* that can be found in the directory called *Pop_Estimate_Dataset* which in turn can be found on <u>learn@uw</u>. Under the materials tab, click on content followed by SQLAssignment to get the data.

There is a layout file for each table in the database. The table layout is helpful in understanding what each attribute means. Section 3 of this document gives you details of the schema of the database.

2 Query the Database

Your task is to write the following queries in separate files, as described below:

File	Query	Output Columns	
Query1.sql	List all states and their values for 2011 housing estimate	(State Code, Housing	
Query 1.sqr	$(\mathbf{HUEST}_{-}2011)$	Estimate)	
Query2.sql	Find the states which have the number of births in 2012	(State Code, Births)	
Query 2.5qr	(BIRTS2012) to be greater than $80,000$	(Brate Code, Births)	
Query3.sql	For each state, print its name and the net migration into	(State Name, Net Migration)	
Query 5.sqr	the state for the year 2012 ($NETMIG2012$)	(State Ivame, Ivet iviigration)	
Query4.sql	Find the number of counties in each state and print it with	(State Name, Count of	
Query4.sqr	the name of the state	Counties)	
	Display names of all "metropolitan statistical		
Query5.sql	areas" (LSAD) and their corresponding migration for the	(Area Name, Net Migration)	
Queryo.sqr	period between June 2010 and June 2011		
	(NETMIG2011)		
	Find each state, print the population estimate in the year		
Query6.sql	2011 (POPESTIMATE2011) of all women aged between	(Age, Population)	
	21 and 45 (both inclusive)		
	For each division, print the name of the division $1\sim9$		
	(DIVISION_DESC) and a list of all states that belong		
Query7.sql	to that region concatenated into one string that is	(Division Name, State List)	
	separated by commas (take a look at the sqlite		
	documentation for the appropriate aggregate function)		

Query8.sql	For each division, find the name of the state that has the greatest increase in housing estimates for the year 2011 (HUEST_2011) as compared to housing estimates for the year 2010 (HUEST_2010)	(Division Name, State Name, Increase)
Query9.sql	For each states, display the percentage of the states estimated 2011 population (POPESTIMATE2011) that is above the age of $21 (\geq 21)$	(State Name, Percentage)
Query10.sql	Find the states for which the ratio of the "2011 resident total population estimates" (POPESTIMATE2011) and "2011 housing estimates base" (HUEST_2011) is below the nationwide ratio. The ratios should be compared in floating point number, not in integer	(State Name)
Query11.sql	For each state, find the name of the county that has the smallest increase in the population between 2011 and 2012 (NPOPCHG_2012). Look at counties individually and not the state as a whole. Display name of state and county and population change in lexicographic order of "Division_Desc". For states with same division, sort in decreasing order of the 2012 population estimate (POPESTIMATE2012) of the county	(State Name, County, Population Change)
Query12.sql	For all age groups, calculate the absolute difference of 2011 population estimate (POPESTIMATE2011) and 2010 population estimate (POPESTIMATE2010). Also, display the indicator that indicates if the population has increased or decreased, or remained the same. The value of indicator should be one of {increased, same, decreased}	(Age, Difference, Indicator)

The sqlite file itself is in binary and does not convey any information about the tables present in it. You may want to use <u>sqlitestudio</u>. This allows you to visualize the tables and run queries on the data which might be useful in the above task.

If you cant write any one of the queries above, provide an explanation of the features that are lacking in SQLite3 that prevents you from being able to write that query. Write these explanations in a file called Queries-readme.txt. To test whether or not your queries work as expected, you can use sqlitestudio or the command below.

Note: To check the query output, we will run the following command on our copy of census.db:

Thus, your text file can have multiple queries, but it must only output your final desired output, and clean up any temporary tables that it creates. You should try to minimize the number of distinct SQL query blocks in each query file – try to write a single query for each of the queries above, whenever possible.

Copy each of your query's result into a separate file called result[1-12].txt, i.e., the word result followed by the query number and .txt. For example, if we want to get the results of Query 5, we would execute the following:

The above command can be repeated for each query with the proper query number substituted in place to get all 12 result files.

3 Schema for the Population Database

Here is a list of tables that are present in the database and the corresponding files in which you can find functional details such as the semantics of each column of the table.

Table Name	Where to Find the Functional Details About the Table
POP_ESTIMATE_NATION_STATE_PR	POP_ESTIMATE_NATION_STATE_PR.pdf
POP_ESTIMATE_STATE_COUNTY	POP_ESTIMATE_STATE_COUNTY.pdf
POP_ESTIMATE_CITIES_TOWNS	POP_ESTIMATE_CITIES_TOWNS.pdf
POP_ESTIMATE_STATE_AGE_SEX_RACE_ORIGIN	POP_ESTIMATE_STATE_AGE_SEX_RACE_ORIGIN.pdf
POP_ESTIMATE_PR_SEX_AGE	POP_ESTIMATE_PR_SEX_AGE.pdf
POP_ESTIMATE_PR_MUNICIPIOS	POP_ESTIMATE_PR_MUNICIPIOS.pdf
POP_ESTIMATE_PR_MUN_SEX_AGE	POP_ESTIMATE_PR_MUN_SEX_AGE.pdf
POP_ESTIMATE_METRO_MICRO	POP_ESTIMATE_METRO_MICRO.htm
HU_UNIT_STATE_LEVEL	HU_UNIT_STATE_LEVEL.pdf

The above mentioned pdf and htm files are present along with the data files in the *Pop_Estimate_Dataset* directory.

We have created six more tables listed below. The above population tables have few columns such as Division, Region, Origin, Race, Sex, Sumlev that have numeric values in it. The meaning for those numeric values can be obtained from these separate tables below. The schemas for these tables are provided below along with the schemas for other tables.

Table Name
REGION
DIVISION
RACE
SEX
ORIGIN
SUMLEV

The file layout for each Population table does not give any information about the Data Type and any Constraints present on the table. It can be referred to know the functional details as to what information is present in each table and what each column in the table means.

We have listed the data type and constraints (Primary and Foreign Key) for each table below. The attribute with value FK in the Cons, field is a foreign key to the primary key of the table with the same name. As you can see below, there are cases where the same attribute is both a primary and foreign key. This might be useful when it comes to writing the actual queries.

REGION

Column	Type	Cons.
REGION_CD	Number	PK
REGION_DESC	String	

DIVISION

Column	Type	Cons.
DIVISION_CD	Number	PK
DIVISION_DESC	String	

ORIGIN

Column	Type	Cons.
ORIGIN_CD	Number	PK
ORIGIN_DESC	String	

SEX

Column	Type	Cons.
SEX_CD	Number	PK
SEX_DESC	String	

RACE

Column	Type	Cons.
RACE_CD	Number	PK
RACE_DESC	String	

SUMLEV

Column	Type	Cons.
